

NAME: Thania G. Querequincia

SECTION: A224

Answer the reflection questions:

A. How did HTML, CSS, and JavaScript help you build your portfolio, and what challenges did you face?

- > HTML is used to create certain sections of your portfolio that you are able to edit. CSS is used to help with your portfolio layout, colors and visuals, and add responsiveness to buttons on your portfolio website. And lastly, JavaScript is used to help enhance the total experience by adding features that help with the entire flow of the portfolio.

- > The challenges I faced in this activity were trying to fit it both on mobile while not breaking something on the desktop view, making them all readable, and what more to enhance to my portfolio.

B. What did you learn from publishing your portfolio on GitHub Pages?

- > I learned how to resize elements to make them fit, what I can improve on for later projects, and maybe with this activity, I can learn to make mockup websites of my own and see how I can stylize the portfolio more like an active playground.
